

# Visual Intelligence Platform

Deep Video Analytics + Visual Data Network

Akshay Bhat  
Cornell Tech, Cornell University.

# An overview of computer vision research by Tomasz Malisiewicz

<http://www.computervisionblog.com/2015/01/from-feature-descriptors-to-deep.html>

# Quick summary

Sift, Graph Cuts

HOG, DPM

Deep Learning

?

Caltech 101, Matlab, OpenCV

VOC, Imagenet, Caffe, Theano

?

# Numerous high quality libraries

- OpenCV
- ROS
- Caffe
- Theano
- Torch
- Tensor Flow
- CNTK
- MXNET
- Torch
- deeplearn.js

# Pre-trained models

- Imagenet classification
  - Inception
  - Resnet
  - VGG
- Detection models
  - R-CNN
  - YOLO
  - SSD
- Face detection / recognition
  - Face-MTCNN
  - Facenet
- Semantic Segmentation models
  - Multipathnet
  - FCN
- Audio embedding models
  - Soundnet

# A deluge of datasets!

- VideoNet
- Yahoo Flickr Creative Commons 100M
- ViCom
- Visual Genome
- YouTube-BoundingBoxes
- Youtube 8M
- imSitu by AllenAI
- Charades by Allen AI
- Udacity car dataset
- KITTI
- Caltech, INRIA, ETH Pedestrians
- Stanford Drone Dataset
- COCO text

We are reaching a stage where

Number of datasets  $\cong$  Number of research groups

With each dataset having its own JSON or XML format, incompatible with all others.

What is hidden in plain sight?

We need a platform which seamlessly  
combines

Data + Models + User Interface

# A Relational Model of Data for Large Shared Data Banks. By Edgar F. Codd

Can we develop an equivalent of relational model / databases for visual data?

Visual Data

=

{ Images, Videos, Annotations, Features }

Relational data : Postgres, MYSQL, SQLite

::

Text, HTML : Lucene/Solr, Elasticsearch

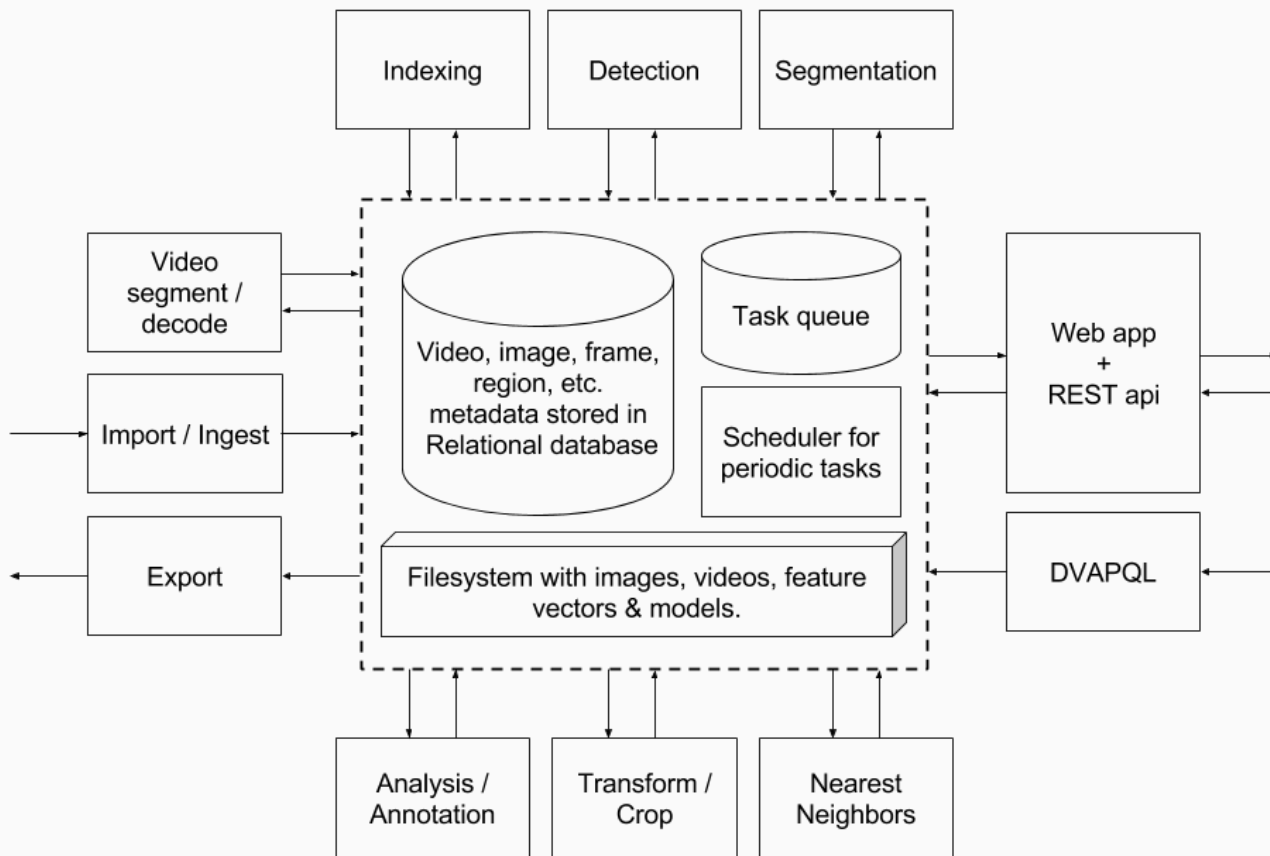

::

Videos & Images : \_\_\_\_\_

# Model-centric

# Model-centric to **Data-centric**

# Previous attempts: LIRE project

- LIRE: Lucene Image Retrieval
  - <http://www.lire-project.net/>
- Developed pre Deep Learning
- Functionality limited to computing & storing feature vectors such as Color Layout, Edge Histogram, etc.

# Previous attempts: CloudCV

- Large Scale Distributed Computer Vision as a Cloud Service
- Support for OpenCV, Graphlab, Cafe
- Image Classification, VQA, stitching, etc
- Does not retain state. E.g. you cannot store images.

# Previous attempts: NVidia DIGITS

- "DIGITS (the Deep Learning GPU Training System) is a webapp for training deep learning models. "
- Load/create datasets, train models, deploy models.
- Aimed at researchers
- Written in Python/Flask with Torch & Caffe supported

# Previous attempts: Visipedia

*Taken from Vision of a Visipedia, Perona et. al.*

# Previous attempts: Visipedia

- Collaborative creation of visual data
- Pre-defined set of concepts E.g. Birds, Trees
- Different type of participants
  - Experts, Annotators, Citizen Scientists, Users, Computer scientists
- Retains state

# Previous attempts: VMX.ai

- Underfunded Kickstarter project Circa Jan 2014
- by Tomasz Malisiewicz
- Pre Tensor Flow, Pre Deep Learning
- Allow developers to create real time detectors
- Support for training model

# Quick recap

- LIRE: limited functionality (Lucene add-on)
- CloudCV: Provides a service, cannot retain “state”
- NVidia Digits: Intended for training not inference
- Visipedia: Intended to be a monolithic deployment

# Ongoing attempts

- Scanner by Alex Poms (CMU) & Will Crichton (Stanford)
  - <https://github.com/scanner-research/scanner>
- Kitware Image and Video Exploitation and Retrieval
  - <https://github.com/Kitware/kwiver>
- VISE project by Oxford VGG group
  - <https://gitlab.com/vgg/vise>

# Why now?

- High quality libraries and pre-trained models
  - TensorFlow
  - Inception, SSD, Facenet
  - Flickr LOPQ, Facebook FAISS
- Cheap GPUs (local & cloud)
- Docker enables deployment of complex applications

Relational data : Postgres, MYSQL, SQLite

::

Text, HTML : Lucene/Solr, Elasticsearch

::

Videos & Images : \_\_\_\_\_

Relational data : Postgres, MYSQL, SQLite

::

Text, HTML : Lucene/Solr, Elasticsearch

::

Videos & Images : ***Deep Video Analytics***

People : Facebook, MySpace

::

Code : Git / GitHub, GitLab

::

Visual Data: ***Visual Data Network***

Relational data : SQL

::

Text, HTML : inverted word index, Page Rank

::

Videos & Images : ***Approximate Nearest Neighbor***

Provides images & videos,  
along with metadata,  
annotations

Deep Video Analytics  
Running locally

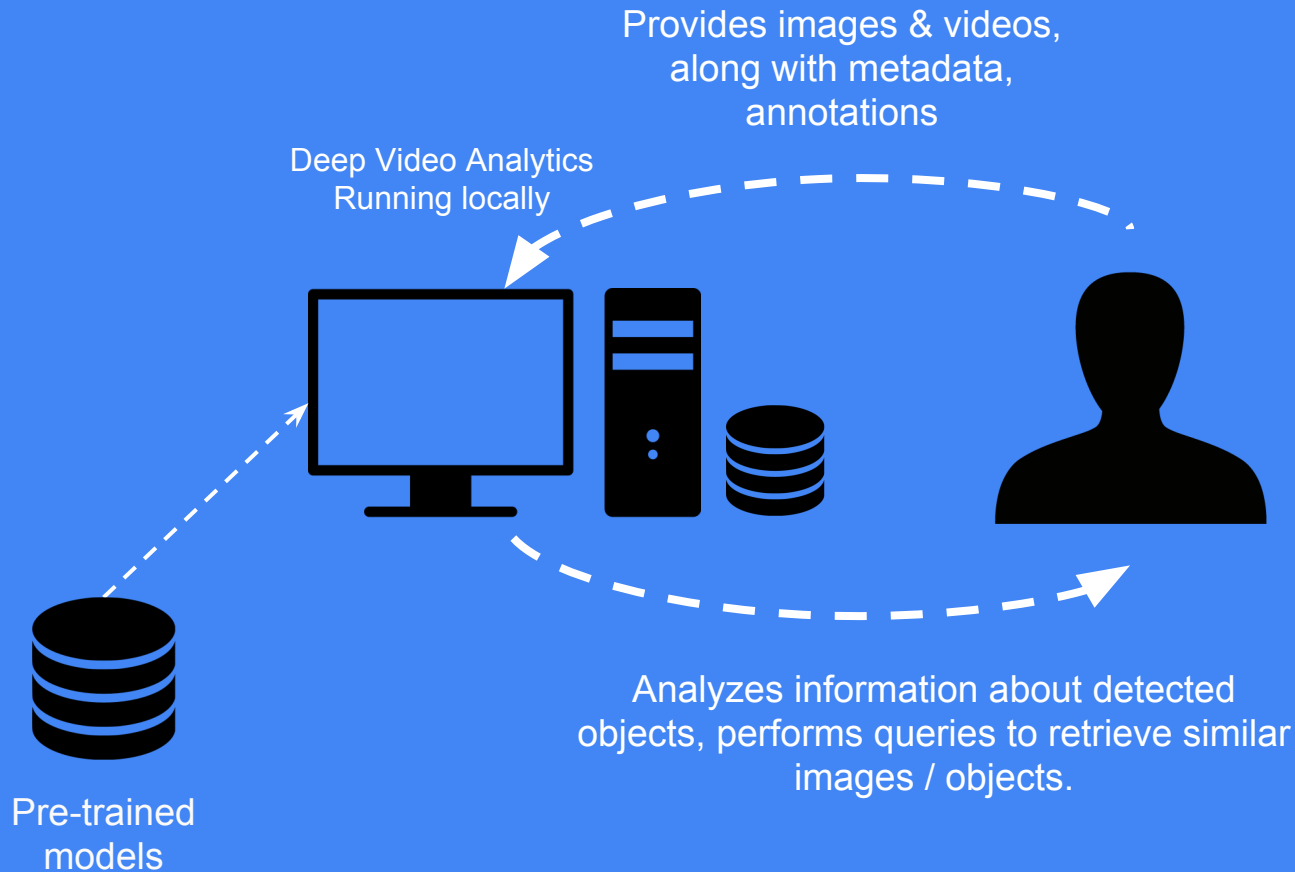

Provides images & videos,  
along with metadata,  
annotations

Deep Video Analytics  
Running locally

# Sharing data using Visual Data Network

Import & export new datasets / annotations  
share with other users

Visual Data Network

# Visual Data Network enables seamless sharing

Push, Pull video / dataset, Annotations, just like you would with GitHub

# Flexible deployment: local & remote server

# Design goals

- Usable by non-researchers
- Visual Search as a “Primary User Interface”
- Users can provide data easily (via upload, youtube-dl, annotation UI etc.)
- Batteries-included approach with an indexing and detection pipeline
  - Tensor Flow Inception v3, VGG-16, Single Shot Detector trained on COCO
  - Face detection / alignment / recognition
  - Deep OCR using CRNN & CTPN. Train new detectors using YOLO+Keras.
- Pre-indexed datasets from different domains can be quickly loaded
- Can be easily customized by developers & researchers.

# Technical goals

- Useful without having to write code or config
- Works on machines with and without GPUs
  - Works (albeit slowly) without a GPU, tested on Linode VPS with 8Gb RAM & 4 Cores
- Handles uploads and continuous index updates
- Data can be easily imported, exported and shared
- Can be easily modified by technical users
  - E.g. Adding more operations to processing pipeline
- Can be scaled out by adding more GPUs / Machines

# Frameworks & technologies used

- Django, Postgres, Celery, RabbitMQ, FFmpeg, Docker
- Tensorflow (primary), Torch, OpenCV & Caffe

What are the core primitives for  
Visual Data Analytics?

# Data & Processing

## Data

- Video / Segment
- Dataset
- Frame / Image
- Regions over an image
- Tubes over sequence of images
- Feature vectors
- Audio

## Processing

- Video Segmentation + Decode
- Indexing
  - Compute features for a region / image
- Detection
  - Detect objects in an image or a region
- Annotation / Analysis
  - Generate a label/metadata given a video, image, region, segment or a tube.
- Transformation
  - Generate a new image/region or tube from existing one. (e.g. segmented object stored as .png file)

Async tasks are underlined

Each box is a data model

Regions are 2D bounding boxes on a frame and can be generated via detectors / annotators or provided via UI, REST API or pre existing metadata. Regions also JSON and text metadata. And can be "Materialized" as a separate image.

Tubes are sequences of Regions. Tubes can be used to represent set of regions or frames or segment for storing metadata about "tracks", "clips" etc.

# DVAPQL

## Deep Video Analytics Process & Query Language

- Specified as JSON
- Three type of scripts
  - Process
  - Query
  - Ingest
- Launch multiple tasks
- Monitor & Wait on tasks
- Use REST API for viewing state & annotation
- Use DVAPQL for launching tasks

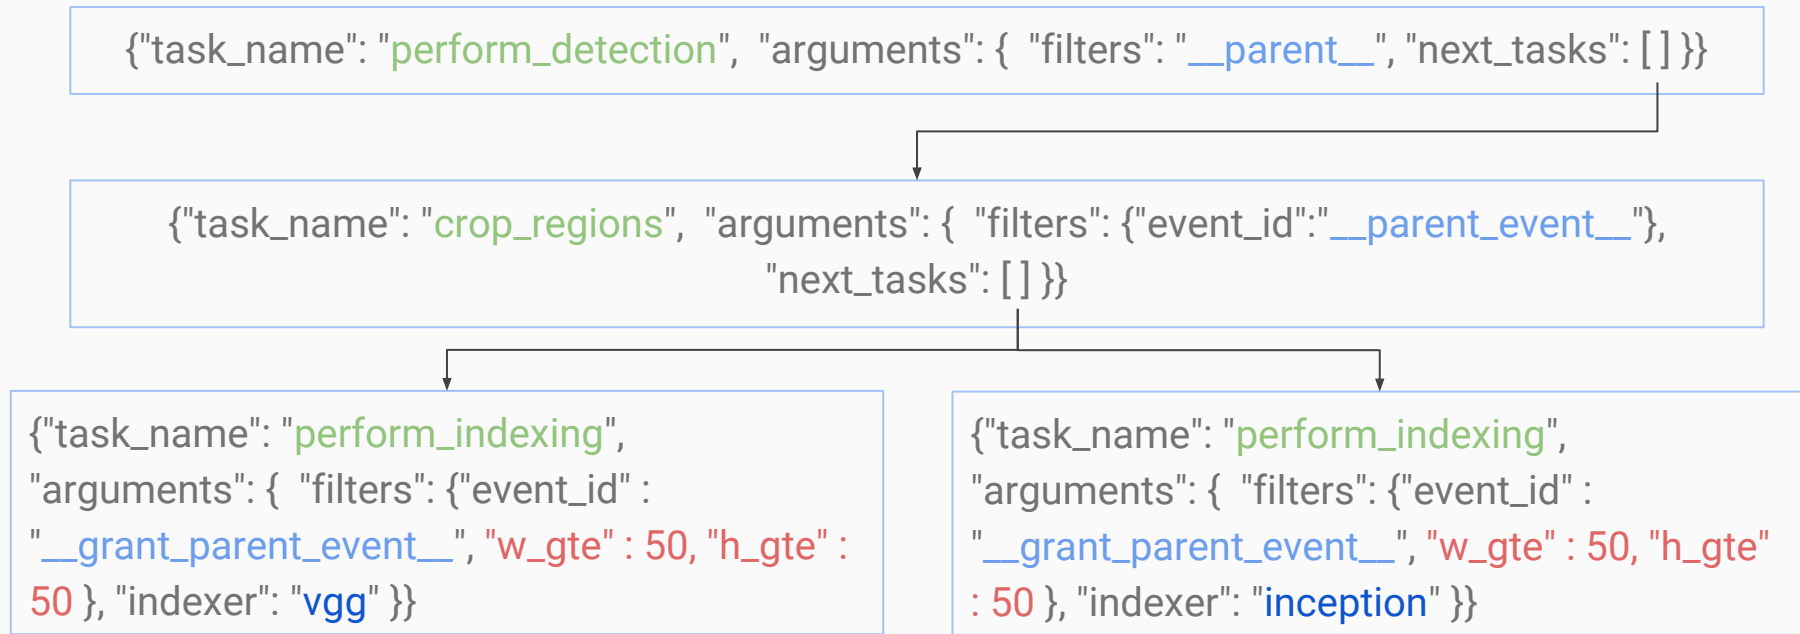

### Example

```
{ "process_type": "V", "tasks": [
  { "operation": "perform_indexing", ... }

  { "process_type": "Q", "b64_image_data": ".....",
    "queries": [ { "indexer_query": "perform_indexing", ...
  }
]}

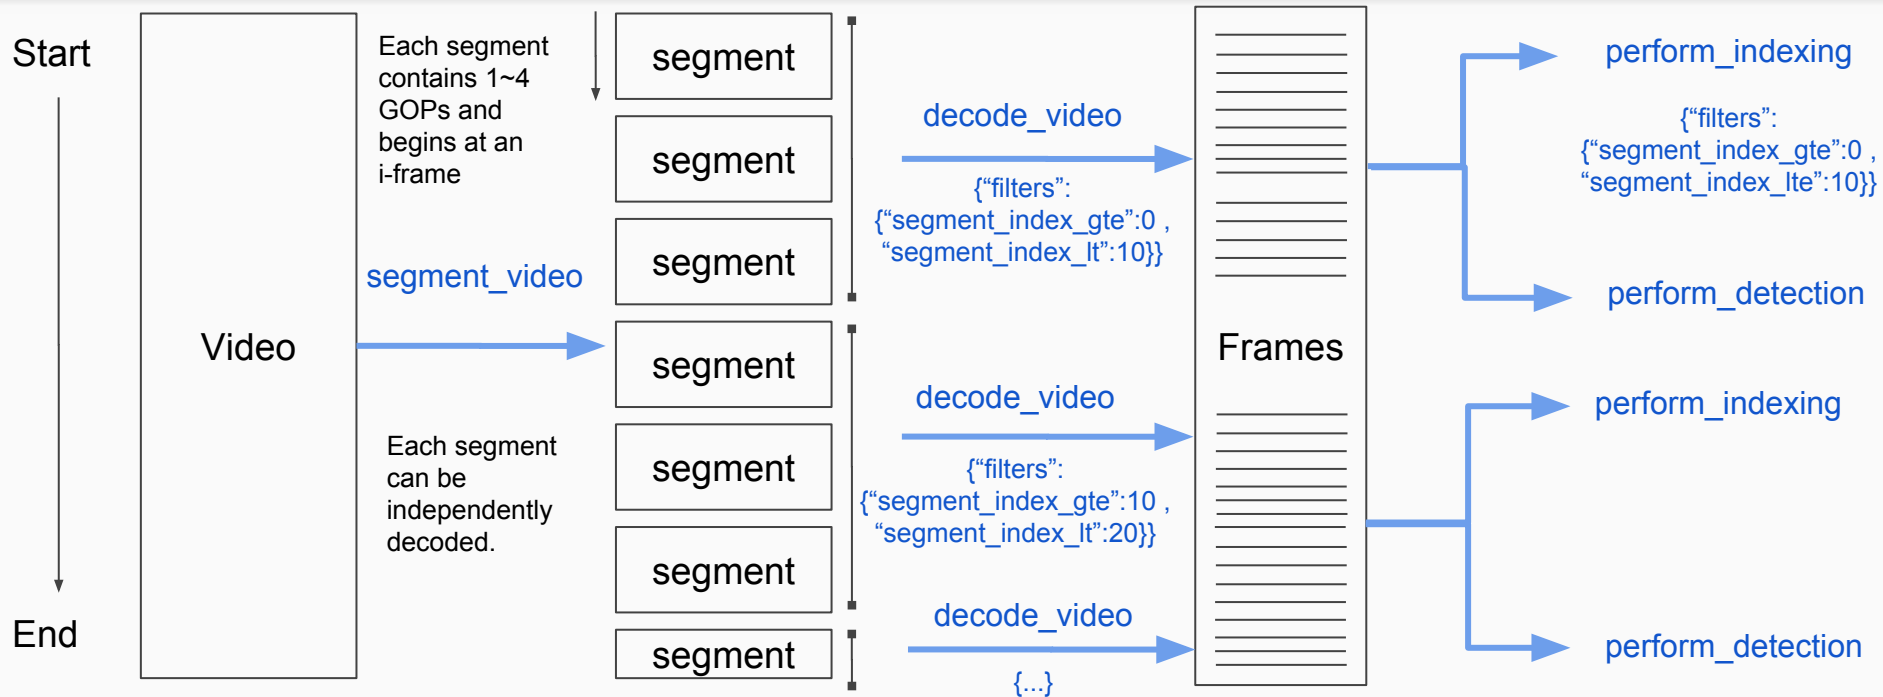

{ "process_type": "I", "tasks": [
  { "operation": "ingest_video", ... }
]}
```

# A task based flexible processing model

All above tasks run on a specific video / dataset which is not shown for brevity.

# Parallelized video processing segment + decode pipeline

# Emulating datacenter on a machine

## *Docker, Docker-compose, Nvidia-docker*

Docker enables same codebase across all configurations {a laptop, multi-GPU machine, datacenter} .

# Deep Video Analytics

## Code organization: dvaapp & dvalib

### **dvaapp:** a django app/project

- Handles UI and data processing
- Data model & Filesystem handling
  - Video, Frame, Detection
  - Query, QueryResult
  - Event, etc.
- Data processing framework using Celery
  - Extract frames / process video
  - Perform indexing
  - Perform detection
- Uses dvalib to carry out tasks

### **dvalib:** library for handling algorithms

- A database & celery agnostic library
- Interface with Tensor Flow & Pytorch for
  - extraction
  - detection
  - indexing

# User Interface:

## Search across frames + detections (faces, etc.)

Deep Video Analytics

Exact Search Completed

Deep Video Analytics

Add Image

Reset Zoom

Clear editor

Clear masks

Exclude

Selected indexes: Inception Facenet

Result count: 20 Send entire image (ignore zoom/pan)

Approximate Search Exact Search

Upload a video or multiple images in a single zip file (example of zip file with jpg images) or an exported ("dva\_export.zip") file.

provide a name:

Files: Choose file No file chosen

Upload

Submit youtube video url. We use youtube v.l.

provide a name:

url of youtube video

submit

Data	Count	View

# Open questions:

A work in progress

- How to rank results using auxiliary information?
- How to balance fast/static vs slow/dynamic indexes?
- How to incorporate text data extracted from images?
- Learning from annotations?
- Real time plug-in that bypasses queue based system?
- An Android / iOS frontend app for data acquisition?

# Thanks!
